

PAS-DALLAS

DALLAS KEY

PAS-DALLAS is a 125 kHz Dallas iButton standard passive transponder. It is compatible with proximity identifier readers, e.g. **CZ-DALLAS**, and thus can be used in the alarm systems based on **INTEGRA** control panels and in the **ACCO** access control systems. It allows the system users to take advantage of the access control functionality, and enables the administrator to identify individual users, record their attendance and working hours, etc.

The device is made in the form of a small metal can mounted on plastic holder. A hole is provided in the holder that allows you to attach the transponder to a lanyard or keychain, which diminishes the risk of it being accidentally lost.

- passive transponder 125 kHz
- work with DALLAS key readers **CZ-DALLAS**
